1 Introduction

This application belongs to the tool-set of Q500log2kml. It was exported from this to this extra tool in order to reduce complexity for usage. This application has two main functions:

- Control a CGO3, CGO3+ or CGO-ET camera,
- Geotagging of JPG-pictures from CGO3 camera.

Important note: Use this application on your own risk. There is no guaranty for correctness and/or completeness of the used data.

Because this all was done by own tests and private researches, the interpretation of the data may be wrong.

On the other hand, this application is freeware. Have fun...

The source code, binaries and documentation is available here:

<https://github.com/h-elsner/CGO3control>

Remark: Camera control will not work with Yuneec C23 or newer cameras.

1.1 Features (short description)

- **CGO3 control:** A simple GUI to control the camera by CGI commands via HTTP.
- **CGO3 test:** Test environment for commands to CGO3 via 5G WLAN connection.
- **GeoTagging:** Add coordinates and altitude from telemetry files to meta data of JPG-pictures from CGO3 that do not have this in EXIF meta. Assignment of data to pictures is based on time stamp.

1.2 Installation

No installation necessary, it is a portable application (only the binary needed). Simply unzip the downloaded file and store it to a directory where you have write access. This can also be a USB stick or a removable drive.

Download [updates](#) and [user manual](#) from my [homepage](#).

To run the application, you might have to suppress Microsoft SmartScreen warnings: Click on "more info" and then "run anyway".

2 Detailed description of the features

2.1 CGO3 control

This is for testing commands to CGO3 and a raw interface to control the camera. Of course, this is only possible if a WiFi connection on 5GHz is established.

The camera creates a WiFi hot-spot. Any capable device can connect to this hot-spot. More devices increase the latency of the connection.

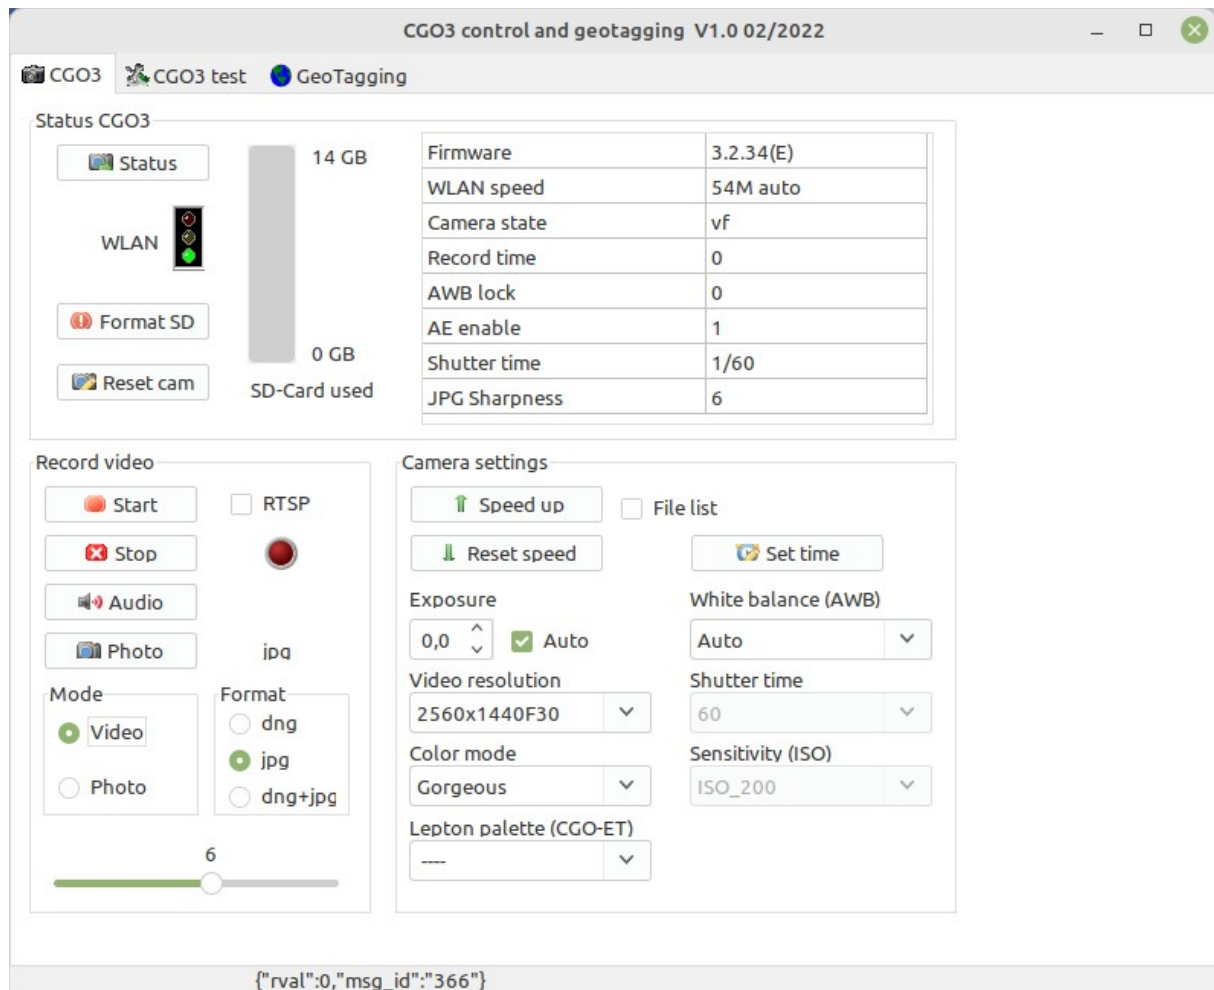

The SSID starts with CGO3_ or CGO3P_ (P for plus) followed by a unique number.

The default password for CGO3 WLAN is **1234567890**. To get connection, a SD card must be in the camera because the password is saved there in a file "MISC\wireless.conf".

To test if WiFi hot-spot of the camera works and check the signal strength a WiFi analyzer app is a good tool.

To initialize and check the connection to the camera hit button Status on CGO3 page first. Traffic light has to go green.

Status CGO3: **Status** will initialize the camera and starts a query to get status of the CGO3. Some results are in the table on the right side. Status query needs to be done first to enable the functions. The traffic light shows the status of the WLAN connection if the **Status** button was clicked.

Format SD is doing a formatting of the SD card in the CGO3. It deletes all files and recreates the needed directories. Also, a new configuration file will be created with standard password for WLAN connection (1234567890).

Reset cam resets all settings of the CGO3 to factory default values.

Record video: **Start** / **Stop** controls video recording. If 'RTSP' is checked the command 'rtsp://192.168.42.1/live' will be sent to local browser. The internet browser must be able to play the RTSP stream. The protocol RSTP must be registered in the browser to make this happen (best is to redirect to VLC player).

Audio: With **Audio** button, you can toggle between Audio on and off.

Photo: Take a shot with **Photo** button.

Mode: You can switch between video and photo mode of the camera. For photo, it is recommended to switch to photo mode. Take a photo in video mode results in bad quality and only jpg.

Format: Select output format of the pictures: .dng is raw format, .jpg is compressed format. With the slider below, the sharpness for picture post processing to jpg format can be set between 1 and 10 (default is 6).

Other settings: To increase the WLAN speed to 56MBit/s, use Speed up. This useful if you want to download or check pictures from the CGO3. Large videos take too long to download via WLAN. If 'File list' is checked then the file system in browser will be opened, offer the possibility to browse and download files from SD card. After those action, it is recommended to set the default WiFi speed by Reset speed. This will set the WLAN speed to default 6MBit/s.

Set time: This will send a command to the camera to set camera internal time to current time.

If exposure is set to automatic (check box 'Auto' checked), then the exposure can be corrected from -2.0 to +2.0 in 0.5 steps.

If exposure is set to manual, then it is possible to select ISO sensitivity and shutter time using related drop down boxes.

You can also select video resolution from full HD, 2K up to 4K, the white balance and color mode (color mode only for jpg pictures).

2.2 CGO3 test

This is a test environment for commands to CGO3, CGO3+ or CGO-ET. Enter only the body of the command (i.e. 'GET_PHOTO_FORMAT'). Prefix 'http://192.168.42.1/cgi-bin/cgi?CMD=' will be automatically added. Below is the field for the return value. "rval":0 means, command checked and executed successful. By double click on this output field, the return value will be copied to the clipboard.

To initialize and check the connection to the camera hit button **Status** on CGO3 page first. Traffic light has to go green. Button **Send command** will be enabled.

CGO3 connected with http://192.168.42.1/

Send command will send the given command to the camera. Result will be shown in the text field.

CGO3 Standard URL: IP-address of CGO3 **with trailing slash** (default: http://192.168.42.1/). This address is used to send CGI- commands via HTTP protocol to CGO3 and receive results.

2.3 Geotagging

ToDo: Coming soon

3.2 IP addresses for video streams

CGO2+/CGO3/CGO3+

Media files: <http://192.168.42.1/DCIM/100MEDIA/>

Live stream: <rtsp://192.168.42.1/live>

CGO-ET

Natural live stream: <rtsp://192.168.42.1:554/live>

Thermal stream: <rtsp://192.168.42.1:8554/live>

MK58/GoPro

Live stream: <rtsp://192.168.110.1/cam1/h264>

Lumix/GCO4

Live stream: <rtsp://192.168.73.254:8557/PSIA/Streaming/channels/2?videoCodecType=H.264>

3.3 Format CGI commands

IP address and prefix	Command	Parameter values
-----------------------	---------	------------------

Examples for CGI commands:

http://192.168.42.1/cgi-bin/cgi?CMD=INDEX_PAGE

http://192.168.42.1/cgi-bin/cgi?CMD=SET_WIFI_SPEED&rate=9

Result starts with return value **rval**. This indicates if the command was successful or not.

In case the CGI command was received and accepted **rval** is 0 and message ID is > 0.

Example: `{"rval":0, "msg_id":1, ...}`

rval < 0 are error codes,

msg_id:0 means unknown message – check if all was proper written, no wrong spaces and so on.

Not all commands will be accepted by your camera.

3.4 Possible commands (not all can/should be used!)
